

Digital bank app

Our team is going to work on the Digital bank app which can be used in both Android and IOS platforms.

We are automating the test cases for the Digital bank application pages (Registration page, Signup/Login Page, Welcome Page and Transfer Page) using Python, Appium, Appium Inspector, PyCharm, Node JS, Pytest, Perfecto tools.

The framework structure using Python with Appium

- We have Config directory which has the configurations and capabilities eg: Device capabilities configuration for Android and IOS
- Logs directory is used to track the results of the test execution with pass/fail details.
- The Pages directory has the details of the different pages in the application such as Registration page, Signup/Login Page, Welcome Page and Transfer Page (using Page object model)
- The Tests directory has the test cases based on the different pages for which we need to test. Successful login, Unsuccessful login etc.
- We are using Github repository for version controlling
